

# Spatial data and analysis in R

## ESM – CDAT course series

**Martin Jung, PhD**  
([jung@iiasa.ac.at](mailto:jung@iiasa.ac.at))

# Course plan

Introduction talk

(14 - 15pm, 22<sup>th</sup> October 2020)

Self study tutorials

(online self paced, link at end of slides)

All slides and materials online

# What is GIS?

*A geographic information system (**GIS**) is a system designed to capture, store, manipulate, analyze, manage, and present types of geographical data.*

# Types of spatial data

Format:

\*.shp, \*.gpkg, \*.gpx, \*.kml, ...

Format:

\*.tif, \*.vrt, \*.hdr, \*.asc, ...

# Vector

**Advantage:** Accuracy, more visually pleasing

**Disadvantage:** Space-inefficient. Every vertex needs to be stored. Algorithms computational intensive.

# Raster

**Advantage:** Geogr. Position associated with data, easier for analysis

**Disadvantage:** Resolution dependent on cell-size. Lack of attributes, MAUP

# Spatial databases

SpatiaLite

PostgreSQL & PostGIS

And many more...

# Stop using shapefiles!

Multifile system (.shp,.shx,.dbf,.prj, ... )

Limited to 2GB (4GB)

Attribute names limitation

Etc...

<http://switchfromshapefile.org/>

**Solution → OGC Geopackages**

# Why use R for spatial analyses?

- ✓ Open source
- ✓ Efficiency ('Don't repeat yourself')
- ✓ Cross system availability (Win,\*Nix, MacO\$)
- ✓ Extendable and rich functionality
- ✓ Clean coding (also for 'tidy' data concept)
- ✓ Parallel computing support
- ✓ Integration of C, C++ code for speed

# Many spatial packages

Environmental Modelling & Software

Volume 133, November 2020, 104799

Position Paper

## Harmonise and integrate heterogeneous areal data with the R package arealDB

Steffen Ehrmann <sup>a, d</sup>  , Ralf Seppelt <sup>b, c</sup>, Carsten Meyer <sup>a, c, d</sup>

# geemap: A Python package for interactive mapping with Google Earth Engine

**Qiusheng Wu<sup>1</sup>**

<sup>1</sup> Department of Geography, University of Tennessee, Knoxville, TN 37996, United States

DOI: [10.21105/joss.02305](https://doi.org/10.21105/joss.02305)

One comprehensive list of spatial  
packages

**[https://cran.r-  
project.org/web/views/Spatial.html](https://cran.r-project.org/web/views/Spatial.html)**

# Why/When not to use R for spatial analyses?

- ❖ R can be slow
- ❖ Many (sp) packages not memory efficient
- ❖ Often little support
- ❖ No GUI
- ❖ Greater proficiency in other languages

(Personal opinion)

**The diversity of open source GIS solutions is both its greatest strength and weakness**

# The backbone of most open-source GIS

# OGC®

Making location count.

Standards like  
WMS, KML, GML,  
SFC

P R Ø J

**GEOS**

Geometry  
Engine  
Open  
Source

C/C++ libraries

# R as a GIS

Main packages: `'sp'`, `'raster'` and `'rgdal'` still go-to functions to use

**Problem:** Each have their own object-based model, often inefficient code

# Tidy data and simple features

**Simple Features are a set of OGC standards how spatial (vector) data is to be stored**

Source: <https://r-spatial.github.io/sf/articles/sf1.html>

```
## Simple feature collection with 100 features and 6 fields
## geometry type:  MULTIPOLYGON
## dimension:      XY
## bbox:           xmin: -84.32385 ymin: 33.88199 xmax: -75.45698 ymax: 36.58965
## epsg (SRID):    4267
## proj4string:     +proj=longlat +datum=NAD27 +no_defs
## precision:       double (default; no precision model)
## First 3 features:
```

	BIR74	SID74	NWBIR74	BIR79	SID79	NWBIR79	geom
## 1	1091	1	10	1364	0	19	MULTIPOLYGON((( -81.47275543...
## 2	487	0	10	542	3	12	MULTIPOLYGON((( -81.23989105...
## 3	3188	5	208	3616	6	260	MULTIPOLYGON((( -80.45634460...

Simple feature

Simple feature geometry list-column (sfc)

Simple feature geometry (sfg)

# Common spatial tasks I do in R

Aligning raster input data

Extracting zonal statistics

Joining spatial and non-spatial data

# What to do if things don't work

## **Too slow**

→ Check memory requirements, consider tiling

## **No Function**

→ Check external tools. Is there a wrapper?

## **Visualization**

→ Use QGIS for quick queries

# Free online books and materials

## Welcome

---

This is the online home of *Geocomputation with R*, a book on geographic data analysis, visualization and modeling.

**Note:** This book has now been published by CRC Press in the [R Series](#). You can buy the book from [CRC Press](#), [Wordery](#), or [Amazon](#).

Inspired by [bookdown](#) and the Free and Open Source Software for Geospatial ([FOSS4G](#)) movement, this book is open source. This ensures its contents are reproducible and publicly accessible for people worldwide.

The online version of the book is hosted at [geocompr.robinlovelace.net](https://geocompr.robinlovelace.net) and kept up-to-date by [GitHub Actions](#), which provides information on its 'build status' as follows:

 Render-Book-from-master passing

This version of the book was built on GH Actions on 2020-10-06.

# Online course materials

## Spatial data and analysis in R

Code ▼

[Martin Jung](#)

Ecosystems Services and Management

International Institute for Applied Systems Analysis (IIASA), Laxenburg, Austria

Apart from the [lecture slides](#) this online self-learning course aims to provide you with basic knowledge about spatial datasets in R, how to load and analyse them. In many instances R might not be the fastest tool one can use for these kinds of analyses, but it certainly is the fastest in terms of time spent in code development. Here we will use R as a wrapper to load in external tools. This course assumes that users already have basic knowledge of R.

I generally tried to avoid replicating things that are already openly available online through other resources. Thus, if you are interested in more or other training materials regarding spatial data and analyses in R, check out the [resources link](#) at the top with more examples and free self-learning tutorials.

<URL>

Thank you for your attention.

Good success with your spatial data!
